

**Press Release – September 13<sup>th</sup>, 2007**

## **Valemount Networks Corporation Enters the Wireless Networking Systems Market**

The developers of StarOS now offer a complete line of fully certified rugged high performance wireless networking equipment. With hundreds of thousands of installations worldwide StarOS is the recognized leader in wireless networking operating systems, offering a number of significant performance advantages for wireless network operators, particularly when used in a homogenous StarOS based network.

### **Valemount, British Columbia, CANADA - September 13<sup>th</sup>, 2007**

Valemount Networks Corporation (VNC) today introduces a new line of complete wireless networking systems which combine the industry leading StarOS operating system with an innovative hardware solution. Products include client, access, and mesh networking systems covering the available frequency bands from 900MHz to 5.8GHz. These rugged units deliver all the performance you would expect from a pioneer and leader in the wireless networking industry. "I'm very pleased and excited about where we're going with these new products. A LOT of blood, sweat, and tears has gone into getting to this point" said Lonnie Nunweiler, President of Valemount Networks. All systems are fully certified and are available to customers worldwide.

Valemount Networks will continue to actively sell and support its StarOS operating system as a standalone product for its large installed base of DIY and OEM customers. "This is an important part of our business and we aren't moving away from it" said Mr. Nunweiler.

The new focus for VNC will be on continued development of innovative systems for its customers. Mr. Nunweiler notes "This is where our strength lies and I think our customers will be very impressed with the additional products and innovations they'll see from us in the coming months, both hardware and software".

Pricing for the new systems is aggressive, and will eliminate the need for operators to spend valuable time and energy building their own equipment. "I feel that a WISP operator's time is much better spent adding to their customer base, while allowing us to build their systems – especially at this price" said Mr. Nunweiler.

In an environment of ever increasing regulatory scrutiny, including self built systems, this allows VNC to provide its customers with a fully certified and compliant solution they can depend on, with the features and performance they've come to expect.

The new range of products from VNC is available on their web site for sampling and evaluation at [www.staros.com](http://www.staros.com). They are also available for evaluation and ongoing volume purchases from their distribution partners, Microcom Technologies in the United States and Canada based Cue-Link, and their resellers worldwide. <http://store.microcom.us/browse-by-brand--valemount-networks.html> and <http://www.cue-link.com/>
